NanoX 2026

September 9, 2026

NDAN is a research architecture for probabilistic cognitive-state interfaces; it is not a claim of direct telepathy or a clinical device.

Beyond WITCOM 2025 NDAN: typed cognitive-state messages with uncertainty, consent scope, provenance, and revocation.

Sensing → state estimation → NSSC message → adaptive networking → governance.

Future nanosensors, flexible electrodes, low-power edge electronics, and biocompatible packaging are defined as validation targets.

Public BCI data, subject-wise evaluation, uncertainty calibration, privacy, latency, energy, and human-in-the-loop safety.
